Heating system: Gas furnace

Fuel Type	Natural gas
Appliance Type	Furnace
Heating AFUE	80
Efficiency Level	Mid-efficiency
Burner Type (stages)	Single-stage
Year of Installation	2020
Number of Heating Systems	1

How This System Affects the Home's Performance

A heating system keeps your home warm during colder weather by delivering heat through ducts, radiators, baseboards, or other distribution systems. Common types include furnaces, boilers, and electric resistance systems. Heating systems produce heat in different ways. Gas, oil, or propane systems burn fuel to create heat, while electric systems use electricity to generate heat without combustion. Most heating systems include a main unit located in a basement, utility room, attic, crawlspace, or garage. Some systems share equipment with air conditioning, while others operate independently.

Safety	This home's furnace uses "natural draft venting." This means that the harmful gases created in the furnace are carried outside through a chimney or vertical flue. In some cases these gases can stay in the home instead of leaving through the chimney.
Comfort	This home's mid-efficiency gas furnace provides single-stage heating, which means it's either off or it's running at maximum output. This provides heat throughout the home, but may not provides as much consistency as 2-stage or fully modulating heating systems.
Operations	This home's gas furnace has an AFUE rating of 80. This means that 80% of the energy from the gas burned in the furnace is turned into heat that can be used in the home. The rest of the energy disappears up the chimney. This is typical for many homes and meets current Federal Minimum requirements.

Next Steps Checklist

Buyers reviewing Safety at this level often choose to ask about the following features to better understand how the home performs.

- [ ] Has the home's gas furnace been routinely serviced and inspected for safe and efficient operation?
- [ ] If the furnace is aging, what plans can you make now for potential replacement in the future?
