Safety

GOOD

115/200

A home's Safety Pillar SCORE shows how the home keeps occupants safe and healthy.

The Safety Pillar looks at the features in the home that prevent the following safety and health problems: harmful airborne particulates, harmful gases, radon, mold, and hazardous materials like lead and asbestos

Safety Comparison

How the Safety assessment of this home measures up to other homes in Fulton county built in the 2020's.

Is this home safe?

Safety features to look for

Look for working smoke and carbon monoxide alarms, proper ventilation, dry and well-sealed foundations and crawlspaces, safely installed equipment, and systems that control moisture, pollutants, and radon.

Feature	Details	Influence on Performance	Year Installed
Heating System	Mid-efficiency (80 AFUE) Natural Gas Furnace	Fuel-burning heating systems that rely on natural draft venting use a chimney or vertical flue to carry combustion gases outside. These systems are common in many homes.	2020
Cooling System	Mid-efficiency (13.3 SEER2), single-stage, air conditioner.	A mid-efficiency (13.3 SEER2), single-stage air conditioner offers limited humidity control and temperature consistency compared to 2-stage or variable-speed systems.	2020
Water Heater	High-effiency (.97 UEF) tankless (instantaneous) water heater.	A sealed-combustion, natural gas tankless water heater heats water on demand and is safer and more efficient than atmospherically vented or power-vented models, but it still carries combustion and gas-line risks compared to electric options.	2025
Attic Insulation	Very good (R-38) blown-in cellulose.	This home's very good attic insulation means that temperatures through the home should be quite even and the home will remain at the temperature it has been heated or cooled to for a long time when the heating or cooling system isn't running. This is particularly true when the home's air tightness is good or very good.	2020
Wall Insulation	Good (R-19) walls	This home's good insulation means that temperatures through the home should be fairly even and the home will remain at the temperature it has been heated or cooled to for a while when the heating or cooling system isn't running. This is particularly true when the home's air tightness is good or very good.	2020
Air Sealing	3ACH50	This home's very good air tightness means that it is very difficult for airborne particles and pollutants to enter from the outside, and the occupants have a good tool to prevent mold growth.	2020

Safety issues to check

Buyers reviewing comfort at this level often choose to ask about the following features to better understand how the home performs across seasons.

- Are the carbon monoxide detectors working and is placed in an appropriate location?
- What type of ventilation does the house have? Are any fans in the bathroom and kitchen vented to the outside?
- Are there gaps and cracks in the foundation?
- Are there gaps and cracks in the weatherstripping around windows, doors, and any opening in building envelope?
- Is all combustion equipment properly vented to the outside?
