Operations

TYPICAL

88/200

A home's Operations Pillar SCORE shows how efficiently the home uses energy and water.

The Operations Pillar evaluates the features that affect utility costs, resource use, and equipment performance - such as heating and cooling systems, insulation, air sealing, water heating, lighting, appliances, and water fixtures.

Operations Comparison

How the Operations assessment of this home measures up to other homes in Fulton county built in the 2020's.

Is this home efficient in operation?

Operations features to look for

Look for features like ENERGY STAR® heating and cooling systems, appliances, WaterSense® fixtures, high levels of insulation, and professional air sealing—all of which help the home operate efficiently and reduce wasted energy.

Feature	Details	Influence on Performance	Year Installed
Heating System	Mid-efficiency (80 AFUE) Natural Gas Furnace	This heating system has a typical efficiency level for its fuel type. Systems in this range generally convert most of their input energy into heat, but may use more energy over the season compared to higher-efficiency models.	2020
Cooling System	Mid-efficiency (13.3 SEER2), single-stage, air conditioner.	This cooling system has a typical efficiency level. Systems in this range generally meet modern Federal Minimum requirements and are more efficient than older systems, but may use more energy over the season compared to higher-efficiency models.	2020
Water Heater	High-effiency (.97 UEF) tankless (instantaneous) water heater.	This water heating system demonstrates excellent operational performance, delivering hot water while minimizing wasted energy during operation.	2025
Attic Insulation	Excellent (R-38) blown-in cellulose.	The attic insulation has a high R-value, which means it slows down heat moving in and out of the home. In winter, it helps keep warm air inside. In summer, it helps keep hot air outside. This helps the home stay more comfortable and reduces how hard the heating and cooling system has to work over time	2020
Wall Insulation	Good (R-19) walls	The exterior walls have good insulation. This helps slow down heat moving in and out of the home. In winter, it helps keep warm air inside. In summer, it helps keep hot air outside. This can make the home more comfortable and help the heating and cooling system run more smoothly over time.	2020
Refrigerator	ENERGY STAR certified	This refrigerator has earned the ENERGY STAR® label, which means it meets strict energy efficiency guidelines set by the U.S. Environmental Protection Agency. Models that earn this label are independently certified to use less energy than standard models while delivering the same performance. This helps reduce energy use and can lower electricity costs over time.	2020
Dishwasher	ENERGY STAR certified	This dishwasher has earned the ENERGY STAR® label, meaning it meets strict energy efficiency guidelines set by the U.S. Environmental Protection Agency. ENERGY STAR certified dishwashers are independently tested to use less energy — and often less water — than standard models, without sacrificing cleaning performance. This can help reduce utility use and operating costs over time.	2020
Smart Thermostat	ENERGY STAR certified	This smart thermostat helps save money by learning your schedule and adjusting the temperature automatically. It lowers heating and cooling when you are away and keeps the home comfortable when you return. By reducing wasted energy, it helps the system run more efficiently over time.	2020

Operations issues to check

Buyers reviewing Operations at this level often choose to ask about the following features to better understand how the home performs across seasons.

- Is the home properly insulated and air sealed?
- Does the home have energy-efficient equipment and appliances?
- Does the home have a swimming pool?
- Does the home have an irrigation system?
